Applications of Correlation

Scilab code Solution 5.01 Radar Signal Processing

```
1 // Exp-8 Application of Correlation in RADAR Signal
    Processing to detect Object and it's Distance.
2
3 // Objective : Correlation finds application in
    RADAR Signal Processing, in which the objective
    is to find whether the object is presence or
    Absence. it also required to find the distance
    between object and radar.
4
5 // R[n]=Alpha*X[n-D]+Noise     where Alpha=
    Attenution Factor = 1 and D= Delay factor by
    which transmitted signal is received back to
    receiver(RADAR)
6
7 // Observation : In the presence of object the
    received signal is reflected signal fron the
    object which can be given by R(n) = X(n-D)+Noise.
     if we find the correlation between received
    signal and transmitted signal, than the
    correlation value is higher at the delay index.
8
```

```
9  // Observation :In the Absence of object the
       received signal is only the Noise, which can be
       given by R(n) = Noise. if we find the correlation
        between received signal and transmitted signal,
       than the correlation value is not higher at the
       delay index what we have get in the presence of
       object.

Scilab code Solution 5.02 Binary Sequence Detection at Receiver

```
1  // Exp-9 : Application of Correlation to detect
       binary sequence at receiver.
2
3  // Objective : To transmite a Binary Signal "0" and
       "1", we used sin(n*pi/8) and sin(n*pi/4)
       respectively. while transmition noise has been
       added with these signals. this information will
       be available to both receiver and transmitter. by
        finding correlation value between received
       signal with noise and the two corresponding
       signals used to represent binary signal "0" or
       "1", at the receiver side we can detect whether
       tranmitted signal is binary "0" or "1"
