1. Graphics

Let us start with simple graphics command

```
--t=-%pi:0.1:%pi;
```

```
--size(t)  
ans =
```

```
1.    63.
```

```
--plot(sin(t))
```

t is a vector given. We check size of the vector with `size` command.

Try with **Help**:

- `plot2d(x,y)`
- `fplot2d(x,f)`
- `subplot` : Multiple graphs
- `xgrid` :
- `xtitle` :
- `xclear` : Clears one or more windows
- `clf()` : Clears the graphic window
- `xbasc`: Clears graphic window and erase recorded graphics

Points to note

- Choice of good interval for the graph is important.
- Smoothness of the graph changes with number of points considered in the given interval. Always check size of the vector you are using for plotting.

- Also check for zeros of the function and make sure that you want to include it in the interval or exclude it.
- Before drawing check what you have asked to draw.
- You will be happy to see the figure which you already thought.

2. Plotting functions of two variables

To obtain 3-D figure for the equation $z = x^4 - y^4$.
Note that command **fplot3d** has arguments as x, y and the function f .

```
--deff('z=f(x,y)', 'z=x^4-y^4')
```

```
--x=-3:0.2:3 ;y=x ;
```

```
--clf() ;fplot3d(x,y,f)
```

3. Graph Titles

We can label X -axis, Y -axis and assign title for the graph:

```
--xlabel('X');  
  
--ylabel(' Y-axis');  
  
--xtitle(' Graph of sin(x)');  
--plot(sin(x))
```

4. Multiple Graphs

We want to compare some graphs. With same set of points. In that case, we can have more than one graph at a time.

```
> x=-2:.01:2
> y=x.^3
> z=x.^5
> w= sin(x)
> plot(x,y,x,z,x,w)
```

Observe the occurrence of x for each of the function in the plot command.

5. Identify Graphs

Though, there are different colours for each graph, since there are more than one graph in one graph window. We would like to know which graphs goes to which function.

for that 'legend' command can be used.

```
> legend('x^3', 'x^5', 'sin(x)')
```

Will put colour marks with the function name.

6. Vector Field

To plot vector field of

$$F(x, y) = x\vec{i} + (x^2 + y^2)\vec{j}$$

Note that coefficient function of \vec{i} is x . Coefficient function of \vec{j} is $x^2 + y^2$. To define these function use `def` the Scilab keyword.

Evaluate fx and fy at values of x and y .

For each of x there will be y . So there will be 11×11 order pairs of (x, y)

Evaluate (fx, fy) for all order pairs of x and y .

```
vx=feval(x,y,fx);
```

```
vy=feval(x,y,fy);
```

Now function vx calculated at each grid point (x, y) same with function vy .

With the command `champ` actual plotting of vector field

```
> champ (x,y,vx,vy)
```

Plots grid points and then plots points calculated at those grid points for function vx and vy .

`champ` joins it as a vector. Initial point of a vector is grid point and direction can be shown with the calculated point.
