Figure 7.1: Analysis of Symmetrical Fault

//Analysis of Symmetrical Fault in Power Systems//

Problem: The one line diagram of a simple power system is shown below. Each generator is represented by an emf behind the transient reactance. All impedances are expressed in per unit on a common MVA base. All resistances and shunt capacitances are neglected. The generators are operating on no load at their rated voltage with their emfs in phase. A three phase fault occurs at bus 1 through a fault impedance of $Z_f = j0.08$ per unit. Determine the fault current in per unit and the current flow from bus 1 to bus 2 after the occurrence of fault.
