codes written in it can be downloaded from the "Textbook Companion Project"
section at the website <http://scilab.in>

Book Description

Title: Wireless Communications and Networking

Author: V. Garg

Publisher: Morgan Kaufmann, San Francisco.

Edition: 2

Year: 2007

ISBN: 978-0-12-373580-5

Scilab numbering policy used in this document and the relation to the above book.

Exa Example (Solved example)

Eqn Equation (Particular equation of the above book)

AP Appendix to Example(Scilab Code that is an Appednix to a particular Example of the above book)

For example, Exa 3.51 means solved example 3.51 of this book. Sec 2.3 means a scilab code whose theory is explained in Section 2.3 of the book.

Contents

List of Scilab Codes	4
2 Multiple Access Techniques	5
3 Radio Propagation and Propagation PathLoss Models	15
4 An Overview of Digital Communication and Transmission	24
5 Fundamentals of Cellular Communications	31
6 Multiple Access Techniques	41
8 Speech Coding and Channel Coding	50
9 Modulation Schemes	54
10 Antennas Diversity and Link Analysis	63
11 Spread Spectrum and CDMA Systems	70
12 Mobility Management in Wireless Networks	81
13 Security in Wireless Systems	84
14 Mobile Network and Transport Layer	86

17 Planning and Design of a Wireless Network	88
19 Wireless Personal Area Network Bluetooth	104
21 Wireless Local Area Network	106
24 Spreading Codes used in CDMA	115

List of Scilab Codes

Exa 2.1	To get Gos during Busy Hour	5
Exa 2.2	To find usage in CCS and Erlangs	5
Exa 2.3	To find offered load	6
Exa 2.4	To find traffic intensity	7
Exa 2.5	To find traffic intensity	7
Exa 2.6	To find traffic intensity in Erlangs and CCS during eight hour period and busy hour . .	8
Exa 2.7	To find traffic per subscriber per BH in Erlangs	9
Exa 2.8	To find average number of BHCAs	9
Exa 2.9	To calculate total traffic and number of MSCs required	10
Exa 2.10	To find the designed cell capacity for the switch and design Erlangs	11
Exa 2.11	To find number of service channels required to handle the load	13
Exa 2.12	To find the number of supported mobile sub- scribers	13
Exa 3.1	To find free space and reflected surface attenu- ations	15
Exa 3.2	To find received signal power and SNR . . .	16
Exa 3.3	To find the allowable path loss	17
Exa 3.4	To find the distance between transmitter and receiver	17
Exa 3.5	To determine type of fading and symbol dis- tortion	18
Exa 3.6	To determine number of fades per second and maximum velocity of mobile	19
Exa 3.7	To determine L50 pathloss	20

Exa 3.8	To determine coverage radius of an access point	21
Exa 3.9	To calculate probability of exceeding signal strength beyond receiver sensitivity	22
Exa 3.10	To find required transmitter power in watts	23
Exa 4.1	To determine the sampling rates	24
Exa 4.2	To determine the SNR	25
Exa 4.3	To calculate spacing between successive pulses of multiplexed signal	26
Exa 4.4	To calculate bits per PCM word sampling rate resultant and symbol transmission rate . . .	27
Exa 4.5	To determine choice of modulation scheme .	28
Exa 4.6	To find choice of modulation scheme without error correcting coding	29
Exa 5.1	To find system capacity	31
Exa 5.2	To find reuse factor for AMPS and GSM . .	32
Exa 5.3	To calculate call capacity of cell and Mean S by I for N as 4 and 7 and 12	33
Exa 5.4	To calculate the number of calls per hour per cellsite	35
Exa 5.5	To calculate calls per hour per cellsite and mean S by I and spectral efficiency	36
Exa 6.1	To calculate spectral efficiency of modulation	41
Exa 6.2	To find multiple access spectral efficiency for FDMA	42
Exa 6.3	To find multiple access spectral efficiency of the TDMA system	42
Exa 6.4	To calculate the capacity and spectral efficiency of TDMA system	43
Exa 6.5	To calculate the frame efficiency and the number of channels per frame	44
Exa 6.6	To calculate capacity and spectral efficiency of the DSCDMA system	45
Exa 6.7	Compare DS CDMA and TDMA omnidirectional cell	46
Exa 6.8	To calculate minimum number of PN chips per frequency word	47
Exa 6.9	To find normalized throughput for different CSMA protocols	47

Exa 6.10	To find data link protocol efficiency with different protocols	48
Exa 8.1	To calculate the gain in the link budget in dB	50
Exa 8.2	To calculate output of convolution encoder	51
Exa 8.3	To demonstrate operations of converting burst errors into bit errors	52
Exa 9.1	To find Eb by No in dB	54
Exa 9.2	To calculate amplitude A of the carrier signal	55
Exa 9.3	To calculate final phase for given bitstream for given modulation method	55
Exa 9.4	To calculate frequency shift along with transmitted frequencies and bandwidth efficiency	57
Exa 9.5	To calculate bit error probability for GMSK	58
Exa 9.6	To calculate bit rate of modulator	59
Exa 9.7	To determine the modulation scheme to be used along with required Eb by No	59
Exa 9.8	Compare the performance of 16PSK with 16QAM	60
Exa 9.9	To find total bandwidth and its efficiency along with required Eb by No and carried bits per symbol	61
Exa 10.1	To find received signal power and SNR of antenna	63
Exa 10.2	To find received signal power and SNR of antenna	64
Exa 10.3	To calculate gain of antenna	65
Exa 10.4	To determine 3dB beam width of an antenna	66
Exa 10.5	To calculate various parameters of helical antenna	66
Exa 10.6	To find probability that SNR will drop below 10dB and compare result with a case of without diversity	67
Exa 10.7	To calculate minimum delay difference to successfully resolve multipath components	68
Exa 11.1	To calculate processing gain and improvement in information rate achieved	70
Exa 11.2	Show that the transmitted signals to mobiles 1 2 and 3 are recovered at the mobile receivers by despreading the resultant signal z	71

Exa 11.3	Minimum number of PN chips required for each frequency symbol	73
Exa 11.4	To calculate data symbol transmitted per hop and number of non overlapping hop frequencies	73
Exa 11.5	To consider various parameters of FHSS systems	74
Exa 11.6	To show how mobile1 will detect its information using a two path rake receiver	75
Exa 11.7	To calculate the time required by mobile to make the required change	78
Exa 11.8	To determine the possible pair of soft slope and add intercept values	79
Exa 12.1	To evaluate the impact of LUs on the radio resource and calculate MSC or VLR transaction load	81
Exa 13.1	To generate public and private keys for RSA algorithm	84
Exa 13.2	To determine the secret encrypting key K using DH key exchange algorithm	85
Exa 14.1	To determine minimum possible latency and window size to achieve this latency	86
Exa 14.2	To calculate upper bound of the throughput for TP connection and throughput with retransmission due to errors	87
Exa 17.1	To calculate various parameters for GSM 1800 network	88
Exa 17.2	To estimate the data and voice traffic per subscriber and per cell	89
Exa 17.3	To calculate data Erlangs along with TS utilization and capacity	91
Exa 17.4	To develop downlink and uplink cell budget and calculate cell radius	92
Exa 17.5	To calculate Uplink cell load factor and pole capacity	93
Exa 17.6	To calculate uplink throughput for WCDMA data service	94
Exa 17.7	To calculate downlink cell load factor and number of voice users per cell	94

Exa 17.8	To determine minimum signal power and maximum allowable path loss	95
Exa 17.9	To develop a radio link budget for uplink and downlink	96
Exa 17.10	To find the number of users supported on the downlink of a WCDMA Network	97
Exa 17.11	find the average throughput for various cases	98
Exa 17.12	TO find the allowable throughput of a reverse link of a CDMA 2000	100
Exa 17.13	To estimate average SINR of a HSDPA . . .	100
Exa 17.14	To find bandwidth of a Iub interface	101
Exa 17.15	To find the required RNCs	102
Exa 19.1	To find hopping rate and various other parameters of Bluetooth	104
Exa 19.2	To find the associated data rate of a symmetric 1soot DM1	105
Exa 21.1	To find number of users supported by WLAN and its bandwidth efficiency	106
Exa 21.2	To find hopping bandwidth and various other parameters for FH MFSK WLAN system .	107
Exa 21.3	To find bandwidth of a subchannel and various other parameters of a OFDM WLAN system	108
Exa 21.4	To find coverage of the AP	109
Exa 21.5	To calculate coded symbol and bit transmission rate per subscriber of the two modes . .	110
Exa 21.6	To find user data rate for HIPERLAN 2 . .	111
Exa 21.7	To determine the collision probability of a FH packet	111
Exa 21.8	To calculate min SIR and using this SIR and other data calculate Rmax	112
Exa 21.9	To calculate Rmax for given interference scenarios	113
Exa 21.10	To calculate Rmax for IEEE 802 11 FH and DS devices	114
Exa 24.1	To generate m sequence and demonstrate its properties	115
Exa 24.2	To generate second m sequence	116

Chapter 2

Multiple Access Techniques

Scilab code Exa 2.1 To get Gos during Busy Hour

```
1 // Exa 2.1
2 // TO get Gos during BH(Busy Hour).
3
4 clc;
5 clear all;
