# Book Description

**Title:** Electrical Machine Design

**Author:** A. K. Sawhney

**Publisher:** Dhanpat Rai

**Edition:** 6

**Year:** 2014

**ISBN:** 9788177001013

Scilab numbering policy used in this document and the relation to the above book.

**Exa** Example (Solved example)

**Eqn** Equation (Particular equation of the above book)

**AP** Appendix to Example(Scilab Code that is an Appednix to a particular Example of the above book)

For example, Exa 3.51 means solved example 3.51 of this book. Sec 2.3 means a scilab code whose theory is explained in Section 2.3 of the book.

# Contents

List of Scilab Codes	4
3 Principles of Magnetic Circuit Design	5
4 Thermal Design Aspects of Electrical Machines	20
5 Design of Transformers	51
6 General Concepts and Constraints in Design of Rotating Machines	67
7 Armature Windings	75
8 Aspects of Design of Mechanical Parts	80
9 DC Machines	85
10 Three Phase Induction Motors	98
11 Design of Synchronous Machines	106
15 Design of Magnetic Circuits	121

16 Design of Heating Elements and Inductors and Welding Transformers	125
18 Design of Starters and Field Regulators	127

# List of Scilab Codes

Exa 3.1	Calculating effective length of air gap . . . . .	5
Exa 3.2	Calculating the mmf required for the air gap of a machine . . . . .	6
Exa 3.3	Estimating the effective air gap area per pole	7
Exa 3.4	Estimating the average flux density in the air gap . . . . .	9
Exa 3.7	Calculating the apparent flux density . . . . .	11
Exa 3.8	Calculating the apparent flux density . . . . .	12
Exa 3.11	Calculating the specific iron loss . . . . .	13
Exa 3.12	Calculating the specific iron loss . . . . .	14
Exa 3.13	Calculating the hysteresis loss . . . . .	16
Exa 3.15	Calculating the magnetic pull and unbalanced magnetic pull and ratio of unbalanced mag- netic pull to useful force . . . . .	18
Exa 4.1	Calculating the loss that will pass through copper bar to iron . . . . .	20
Exa 4.2	Calculating the loss that will be conducted across the the laminations . . . . .	21
Exa 4.3	Calculating the heat radiated from the body	22
Exa 4.4	Calculating the length and width of strip . .	23
Exa 4.6	Estimating the temperature of the hot spot	25
Exa 4.7	Estimating the hot spot temperature . . . . .	26
Exa 4.8	Calculating the maximum temperature differ- ence between the coil surface and the winding	27
Exa 4.9	Calculating the temperature difference between the centre of the embedded portion of a con- ductor and the overhang . . . . .	29

Exa 4.11	Calculating the heat conducted across the former from winding to core . . . . .	30
Exa 4.12	Estimating the final steady temperature rise of coil and its time constant . . . . .	31
Exa 4.13	Calculating the final steady temperature rise of coil surface and hot spot temperature rise	33
Exa 4.15	Calculating the temperature rise and thermal time constant and rating of the machine . .	34
Exa 4.17	Calculating the temperature of machine after one hour of its final steady temperature rise	36
Exa 4.19	Calculating the rate of change of temperature	37
Exa 4.22	Calculating the volume of air required per second and fan power . . . . .	38
Exa 4.23	Calculating the efficiency of machine and amount of cooling water . . . . .	40
Exa 4.24	Calculating the temperature rise of hydrogen	41
Exa 4.25	Calculating the amount of oil and amount of water . . . . .	42
Exa 4.26	Calculating the temperature rise of tank . .	44
Exa 4.27	Calculating the amount of water required and area of water duct and pumping power . . .	45
Exa 4.35	Calculating the continuous rating of motor .	47
Exa 4.37	Calculating the mean temperature rise . . .	48
Exa 4.43	Calculating the temperature rise . . . . .	49
Exa 5.3	Calculating the kVA output of a single phase transformer . . . . .	51
Exa 5.6	Calculating the net iron area and window area and full load mmf . . . . .	52
Exa 5.9	Calculating the net iron area and window area	54
Exa 5.12	Calculating the resistance of secondary winding . . . . .	55
Exa 5.13	Calculating the leakage reactance of the transformer referred to the HV side . . . . .	56
Exa 5.14	Calculating the per unit leakage reactance .	58
Exa 5.16	Calculating the instantaneous radial force on the HV winding if a short circuit occurs at the terminals of the LV winding with HV energised and the force at full load . . . . .	60

Exa 5.17	Calculating the instantaneous radial force and instantaneous axial force on the HV winding under short circuit conditions . . . . .	61
Exa 5.18	Calculating the maximum flux and no load current of the transformer . . . . .	62
Exa 5.20	Calculating the number of turns and no load current . . . . .	65
Exa 6.1	Calculating the specific electric and specific magnetic loading . . . . .	67
Exa 6.5	Calculating the power developed by the armature of motor . . . . .	68
Exa 6.6	Calculating the limiting value of specific magnetic loading . . . . .	70
Exa 6.8	Calculating the maximum permissible specific electric loading . . . . .	71
Exa 6.9	Calculating the specific electric loading . . .	72
Exa 7.33	Calculating the rms line voltage and circulating current . . . . .	75
Exa 7.41	Calculating the eddy current loss ratio and average loss ratio and critical depth for minimum loss . . . . .	76
Exa 8.2	Calculating the stress on the ring . . . . .	80
Exa 8.4	Calculating the tensile stress and factor of safety . . . . .	81
Exa 8.5	Calculating the inertia constant of the generator . . . . .	83
Exa 9.7	Calculating the maximum permissible core length for the machine . . . . .	85
Exa 9.8	Calculating the maximum permissible output from a machine . . . . .	86
Exa 9.9	Calculating the number of extra shunt field turns to neutralize the demagnetization . . .	87
Exa 9.10	Calculating the demagnetizing and cross magnetizing mmf per pole . . . . .	89
Exa 9.12	Calculating the armature voltage drop . . .	90
Exa 9.26	Calculating the number of turns on each commutating pole . . . . .	91

Exa 9.27	Calculating the reactance voltage for a machine with straight line and sinusoidal commutation . . . . .	92
Exa 9.32	Calculating the minimum number of poles .	94
Exa 9.33	Calculating the maximum armature voltage	95
Exa 9.34	Calculating the total commutator losses . .	96
Exa 10.2	Calculating the main dimentions of squirrel cage induction motor . . . . .	98
Exa 10.13	Calculating the number of stator and rotor turns and rotor voltage between slip rings at standstill . . . . .	99
Exa 10.15	Calculating the number of stator turns per phase . . . . .	101
Exa 10.16	Calculating the magnetizing current per phase	103
Exa 10.19	Calculating the current in rotor bars and in end rings . . . . .	104
Exa 11.4	Calculating the suitable number of slots and conductors per slot . . . . .	106
Exa 11.10	Calculating the size of armature wire and the ac resistance of each pahase . . . . .	107
Exa 11.11	Calculating the length of air gap . . . . .	109
Exa 11.13	Calculating the stator bore and stator core length and turns per phase and armature mmf per pole and mmf for air gap and field current	111
Exa 11.14	Calculating the flux per pole and length and width of pole and winding height and pole height . . . . .	114
Exa 11.18	Calculating the direct and quadrature axis synchronous reactances . . . . .	115
Exa 11.20	Calculating the kVA output of the machine	117
Exa 11.32	Calculating the number of stator slots and average flux density . . . . .	119
Exa 15.1	Calculating the current in exciting coil . . .	121
Exa 15.4	Calculating the winding depth and winding space and space factor and the number of turns	122
Exa 16.2	Calculating the inductance . . . . .	125

Exa 18.1	Calculating the upper and lower limits of current during starting and resistance of each section . . . . .	127
----------	--	-----

## Chapter 3

# Principles of Magnetic Circuit Design

Scilab code Exa 3.1 Calculating effective length of air gap

```
1 // Calculating effective length of air gap
2 clc;
3 disp('Example 3.1, Page No. = 3.12')
4 // Given Data
5 Ws = 12; // Slot width in mm
6 Wt = 12; // Tooth width in mm
7 lg = 2; // Length of air gap in mm
8 Kcs = 1/(1+(5*lg/Ws)); // Carter's co-efficient for
   slots
9 // Calculation of effective length of air gap
10 ys=Ws+Wt; //Slot Pitch in mm
11 Kgs=ys/(ys-(Kcs*Ws)); //Gap contraction for slots
12 Kgd=1; //Gap contraction factor for ducts//Since there
   are no ducts
13 Kg=Kgs*Kgd; //Total gap contraction factor
14 lgs=Kg*lg; //Effective gap length in mm
15 disp(lgs, 'Effective gap length(mm)=');
```

A screenshot of the Scilab 5.5.2 Console window. The window title is "Scilab 5.5.2 Console". The text inside the console reads: "Example 3.1, Page No. = 3.12", "Effective gap length(mm)=", "2.75", and "-->". There is a "Rectangular Snip" button below the text.

```
Scilab 5.5.2 Console
Example 3.1, Page No. = 3.12
Effective gap length(mm)=
2.75
-->
```

Figure 3.1: Calculating effective length of air gap

16 //in book answer is 2.74 mm. The answers vary due  
to round off error

---

**Scilab code Exa 3.2** Calculating the mmf required for the air gap of a machine

```
1 // Calculating the mmf required for the air gap of a
  machine
2 clc;
3 disp('Example 3.2, Page No. = 3.12 ')
4 // Given Data
5 L = 0.32; // Core length in meter
6 nd = 4; // Number of ducts
7 Wd = 10; // Duct width in mm
8 Pa = 0.19; // Pole arc in meter
9 ys=65.4; // Slot Pitch in mm
10 lg = 5; // Length of air gap in mm
11 Wo = 5; // Slot opening in mm
```

```

Scilab 5.5.2 Console
Example 3.2, Page No. = 3.12
mmf required for air gap(A)=
3594.5992
-->

```

Figure 3.2: Calculating the mmf required for the air gap of a machine

```

12 Fpp = 52; // Flux per pole in mWb
13 Kcs = 0.18; //Carter's co-efficient for slots
14 Kcd = 0.28; //Carter's co-efficient for ducts
15 // Calculation of mmf required for the air gap
16 Kgs=ys/(ys-(Kcs*Wo)); //Gap contraction for slots
17 Kgd=L/(L-(Kcd*nd*Wd*10^(-3))); //Gap contraction for
    ducts
18 Kg=Kgs*Kgd; //Total gap contraction factor
19 Bg=Fpp*10^(-3)/(Pa*L); //Flux density at the centre
    of pole in Wb per meter square
20 ATg=800000*Kg*Bg*lg*10^(-3); //mmf required for air
    gap in A
21 disp(ATg, 'mmf required for air gap(A)=');
22 //in book answer is 3587 A. The answers vary due to
    round off error

```

---

Scilab code Exa 3.3 Estimating the effective air gap area per pole

```

1 // Estimating the effective air gap area per pole

```

```

Scilab 5.5.2 Console
Example 3.3, Page No. = 3.13
Effective air gap area per pole(meter square)=
0.0404521
-->
Rectangular Slot

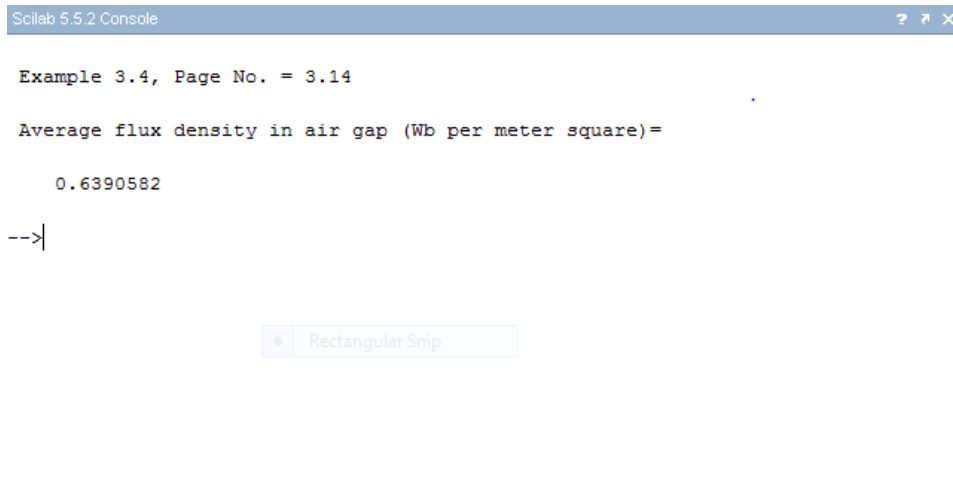

```

Figure 3.3: Estimating the effective air gap area per pole

```

2  clc;
3  disp('Example 3.3, Page No. = 3.13 ')
4  // Given Data
5  P = 10; // Number of pole
6  Sb = 0.65; // Stator bore in meter
